# **IL-1 & IL-2 Interior Lighting for Model Railroad Buildings**

**[www.eaelec.com](http://www.eaelec.com)**

**Made in Canada**

## **Introduction**

The IL-1 is a product for interior lighting of model railroad buildings. It uses a high efficiency white LED to provide bright light with a minimum of current. The IL-2 is identical to the IL-1 except the wire leads are longer.

## **Specifications**

Input Voltage Range - 3.3 volts to 5 volts DC - (requires 5 volts for full brightness)

Current Drain - 3 milliamps at 5 volts

Maximum Reverse Voltage - 5 volts

Physical Dimensions of Printed Circuit Board: 6 mm X 5 mm ( .23" by .2" )

Wire Leads Length IL-1 – 20 cm ( 8 inches )

Wire Leads Length - IL-2 – 40 cm ( 16 inches )

## Mounting The Unit

Model railroad buildings made by eaelec.com feature a holder built into the roof for easy mounting. Glue the circuit board into the holder with CA or double sided tape glue as shown below.

Glue board to holder

## Connecting The Unit

One way of connecting the unit to a DC power source is to run a power bus under your layout. A power bus is simply two parallel strands of uninsulated solid copper wire. The wires from the IL-1 (or IL-2) are soldered to the bus as shown below. This assumes you are handy with a soldering iron.

Another way of connecting is to use screw terminal strips which can be wired without soldering.

DC power bus on the underside of layout
